# Lesson Plan

- Conduit
- Next Week
  - Conductor ampacity and voltage drop

- Conduit comes in various configuration
  - EMT Electrical Metallic Tubing
    - Thin wall conduit
    - 40% thinner than rigid
    - Lighter, easier to bend, & no threading
  - RMC Rigid Metal Conduit
    - Heavy duty
    - · Requires threading-like plumbing
    - Generally used for service entrance risers.
  - IMC Intermediate Metal Conduit
    - Between RMC and EMT
    - Can be threaded
  - PVC Polyvinylchloride
    - Cheaper alternative
    - High coefficient of thermal expansion
  - FMC Flexible Metal Conduit
  - LFMC Liquidtight Flexible Metal Conduit
  - FMT, LFNMC, ENT

### Conduit comes in various sizes

- ½", ¾", 1", 1-¼", 1-½", 2", 2-½", 3", 4"
- For the "same size" conduit- EMT, IMC and RMC may have a different inside area

### Per NEC

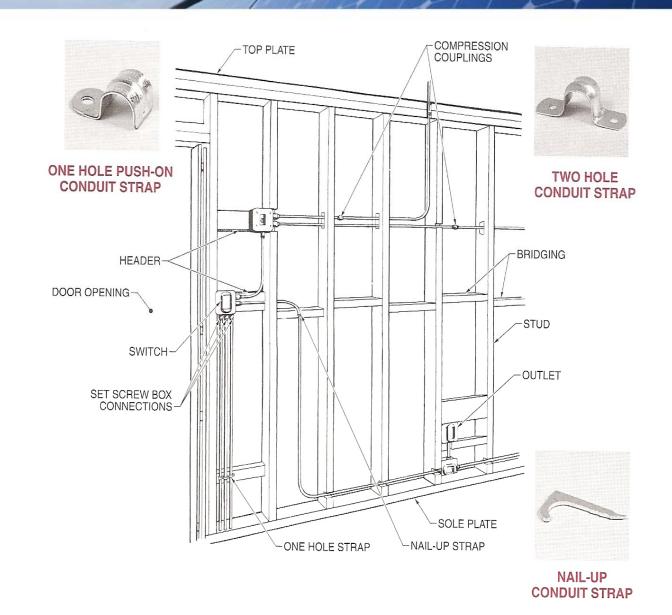

- Min size =  $\frac{1}{2}$  inch
- Permitted usages vary for each type
- Article 358: EMT

### Support requirements (RMC, EMT, IMC)

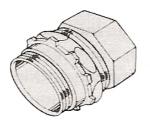

- Securely fastened every 3m (10ft)
- Within 0.9m (3ft) from every junction box, outlet, transition, direction change
- Should follow horizontal and vertical lines, smooth transitions
- No more than 4 quarter bends between pull points

# Conduit Discussion

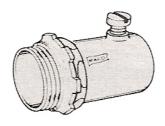

- EMT must be firmly secured to electrical boxes using compression, indenter, or screw set connectors.
  - Compression firmly secures the conduit by utilizing a nut that compresses a tapered metal ring into the conduit.
    - Can be reused several times
  - Indenter Use of a special tool to make an indention (swaging)
  - Set Screw used to connect two runs of conduit together and maintain a smooth inside run.

COMPRESSION

INDENTER

How many 10AWG THWN-2 conductors can be run through ¾ inch EMT?

0.213 / 0.0211 = 10 conductors

Box offset - offset that allows conduit to align with box

opening

Dog leg – Mistake in bends when legs do not line up<sup>10</sup>

- Take-up is the length of pipe to remove from desired height to make the a stub
  - 5 inch for ½ inch bender
  - 6 inch for ¾ inch bender
  - 8 inch for 1 inch bender
- Offset chart is used to calculated proper lengths for various bends
  - 30 degree = 2X length
  - $-30 \text{ degree} = \frac{1}{4} \text{ X shrink}$

# Conduit Exercise

### Every get a 10ft piece of ½ in EMT

- Bend a 12" stub in
- Bend a 24" back to back from the first stub
- Cut and file the tube so that you have two 12" back to back stubs

Using remaining piece of ½ in EMT

Bend a 30 degree 5" offset
